Model outcomes for the agent's seat in the calibrated Stage B environment (3 stages, 3 periods; continue 0.8 billion won/50%, accelerate 2.5 billion won/80%; prizes 10/3/6.5 billion won; entry 35% per period multiplying unfinished prizes by 0.5; 40% one-stage observation error). Columns 4–6 unconditional; 7–9 conditional on no entry within the horizon. Source: results/05_agent_stage_b.json (model_predictions), results/05_stage_b_env_calibration.json.
