Hypothesis (pre-registered)	Estimate	Cluster SE	Wild CI	p (one-sided, wild)	Holm	Decision	N / clusters
H1 Escape: threat × frontier → pre-emption	+0.0144	0.0063	[+0.0019, +0.0266]	0.016	0.064	directional	16,594 / 114
H2 Exit: threat × laggard → quit	+0.0057	0.0070	[-0.0095, +0.0204]	0.209	0.418	directional	7,987 / 112
H2 (objective): entry rate × laggard → quit	+0.1119	0.0474	[-0.0299, +0.2601]	0.072	–	–	7,987 / 112
H3 Quit asymmetry: laggard − frontier	-0.0033	0.0082	[-0.0206, +0.0128]	0.675	0.675	not supported	7,987 / 112
H4 Pre-emption asymmetry: frontier − laggard	+0.0101	0.0062	[-0.0024, +0.0230]	0.056	0.168	directional	16,594 / 114
H5 Baseline: laggard − frontier quit	+0.0279	0.0106	[+0.0049, +0.0497]	0.007	0.035	supported	7,987 / 112
H6 Entry rate × frontier → pre-emption (TOST)	-0.0418	0.0220	[-0.0953, +0.0146] (90%)	0.210 (2-s.)	–	inconclusive	16,594 / 114

Linear probability models with industry (2-digit) and wave fixed effects and controls; estimate = change in probability per unit of the treatment within the gap group (perceived threat: within-wave residual of the entry-threat item on the other seven market-environment items, pooled SD 1.005; entry rate: standardised; H5: difference of group intercepts at average threat). Inference: wild cluster bootstrap-t, Rademacher, 999 draws, clusters = industry × wave; Holm across H1–H5. Decision rule as pre-registered (OSF tj9uv). Source: results/06_kis_main.json.
