Estimate (one-sided wild bootstrap p; 299 draws for pre-registered robustness rows, 999 for the main and exploratory rows). Pre-registered robustness specifications are reported, not used for decisions; the two quit-definition rows change only the abandonment outcome, so their H1 and H4 entries repeat the main pre-emption model. The R&D-intensity proxy row is exploratory (innovation-active firms only, N = 7,969). The two threat-residual rows rebuild the treatment as the within-wave residual of the entry-threat item on the eight-item mean (the recipe in the registration text) or on the mean of the other seven items, standardised, with the same index as the response-propensity control; H6 does not use the perceived treatment.
